

KOI CARE

Algiclear

algae and particulate remover

Algae are an unwelcome guest in any pond, whereas, a small amount is inconsequential, blooms of algae are most problematic. Floating unicellular algae cause green water, and obscure your vision of the fish, and cut down light to the plants you want in the pond.

Algiclear is a liquid chemical flocculant. When added to the water it causes floating particles to clump together so that they either sink, are filtered out, or can be removed with a fine net.

Only use the treatment when you have plenty of time to observe the fish, so that action can be taken in the unlikely event of an adverse reaction. Remember that some treatments can lower the dissolved oxygen content of the water, so ensure there is adequate oxygenation of the pond, either via a pump or air-stone.

The following precautions are also recommended:

- Do not use if there is a nitrite level in the water
- Do not use in humid, thundery weather
- Do not use immediately after feeding
- Do not use in the evening
- Increase aeration
- Keep filters clean

Dosage: Flush the pond as clear as possible with fresh water before use. Use 10 mls per 40 UK gallons (182 L) of pond water. Mix the full dose into a bucket of pond water, add this to the pond, and stir into the water.

One dose should be enough to clear your pond if the instructions are followed carefully. If no effect is seen within a few hours of application, do not add more Algiclear, wait a few days and try to establish why the water has not cleared. Then follow the instructions again when re-dosing.

Pack size	Treats		
	Litres	Imp. Gallons	US Gallons
250 ml	4 546	1 000	1 200
500 ml	9 000	2 000	2 400
