

**POND AID****All You Need for a Crystal Clear Pond**

The most economical way to treat your pond.

**Magiclear** - clears green water

**Aquaclear** - keeps it clear

Green water is caused by an overgrowth of algae. Water can also be cloudy due to suspended particles. **Magiclear** causes particles and algal cells to clump together so that the clumps can be easily removed from the pond.

When the water is clear, **Aquaclear** will keep it that way by filtering out the light which causes the algae to grow.

The following pages give more details of these two products which you can buy together in this **All You Need** bargain pack

**POND AID**
**Magiclear**

For a crystal clear pond. Flocculates particles in water assisting in filtration, improving clarity rapidly. Harmless to fish & plants.

Magiclear safely removes suspended solids from pond water leaving the water crystal clear. Magiclear causes particles in the water to clump together and settle to the bottom. If a pumped filter is in use the clumps will be removed by the filter leaving the water clear and free from all suspended solids. Without a filter some clumps may float and can be removed with a net.

Harmless to plants. Harmless to Orfe. Does not affect bacterial filters.

**Caution:**

The sudden removal of algae from a green pond can result in a drop in oxygen level in the water causing stress to the fish.

If the pond is very green, flush clear with fresh water then polish with **Magiclear**.

Other possible causes of low oxygen in the water are:

Immediately after feeding

If there is a nitrite level in the pond (indicating filter problems)

Humid, thundery weather.

We, therefore, recommend the following precautions especially if the pond is very green:

Do not treat within 6 hours of feeding, in the evening, if there is nitrite in the water or during humid, thundery weather.

Aerate well. Keep filters clean.

As with all water treatments, use only when you have plenty of time to observe fish and take action in the unlikely event of a reaction.

For use in ornamental ponds only.

**Dosage:**

Add 10 ml to 40 gallons (180 litres) of water.

Pack size	Treats		
	Litres	Imp. Gallons	US Gallons
250 ml	4 546	1 000	1 200
500 ml	9 000	2 000	2 400
1000 ml	18 000	4 000	4 800

**POND AID**
**Aquaclear**

For control of Algae and blanket weed in ponds. Restricts growth using a UV screening, faint blue dye. Harmless to wildlife, plants, pondlife & pets.

Sunlight, shining onto the water supplies the energy for algae and blanket weed to grow.

Shading the water reduces the amount of light available and, therefore, the growth of algae and blanket weed.

This product is used widely in US golf courses to control algae and weeds in water hazards.

Aquaclear needs to be maintained at working strength throughout the season and is not suitable for ponds where there is a flow-through of water.

To control blanket weed, it is best to apply Aquaclear early in the year, before the growing season starts. This is because blanket weed is a kind of algae which first starts growing as a unicellular green algae before attaching itself to surfaces and forming the unsightly threads which we all know as blanket weed.

If stopped in the early phase of growth, it cannot develop into the nuisance we all know.

**Dosage:**

Add 10 ml to 125 gallons (560 litres) of pond water.

Top up the colour every 6 weeks during the season.

Pack size	Treats		
	Litres	Imp. Gallons	US Gallons
250 ml	14 000	3 125	3 700
500 ml	28 000	6 250	7 400
1000 ml	56 000	12 500	15 000
