Hi Garry,

I bought my 8.5kw heat pump on approx 15/08/2010 for my Kio Pond of some 2,000 gals and have been using it non stop even through the winter. The lowest winter temperature here has been -14.8C and the heat pump was still working and keeping my pond at +10C

I thought you would like to know that I have checked the power that the unit is drawing today 03/01/2012 at an ambient air temperature of +5.4C.

It is only drawing 1.3Kw when the specifications say it should draw 1.7Kw. This unit is giving me a massive 650% (C.O.P. 6.5) efficiency even in the winter time at such low ambient temperatures.

I am really pleased with my purchase.
